Integrated Systems

The possibility of communicating with third-party systems

Guardian Exchange

The data present in the Guardian database represent an informational wealth that can be made available and usable to systems created by third parties.

The same database can be powered by data published by third-party systems.

The Guardian Exchange module allows the Guardian Kernel system to exchange data relating to systems connected to the company's information system or to other management systems not necessarily related to security.

Data Exchange

With the Guardian Exchange module, the Guardian system exchanges data related to systems connected to the company's information system or to other non-safety related management systems.

The Guardian Exchange module natively offers a series of data that can be made available through the most common communication interfaces on the market (WebServices, JSON, XML, CSV, OLAP, ...). By authentication and registration each system can obtain and exchange the requested data.

The software is predisposed to customizations aimed at integration with third-party applications, so as not to dispose of anything and even create an interconnected architecture that results in a single system easy to maintain for the operator.
